

SAVER Purchasing Report — All Sessions

Mid-Mount Ladder Work Group — Miami Beach Fire Department

Generated: March 16, 2026 3:07 PM

****EXECUTIVE DATA ANALYSIS REPORT**** ****Mid-Mount Ladder Truck Equipment Evaluation — Data Analysis**** ****Date:**** March 16, 2026 ****Prepared for:**** Health & Safety Committee, Fire Chief Digna Abello, Command Staff **## EXECUTIVE OVERVIEW** The Mid-Mount Ladder Truck Equipment Evaluation was conducted to assess and compare various equipment options for the Miami Beach Fire Department. The purpose of this evaluation and data collection effort is to gather comprehensive feedback from evaluators on the performance, features, and suitability of different products. Unfortunately, due to the absence of specific data on the number of products evaluated, total evaluators, total submissions, and categories evaluated, a detailed summary of participation cannot be provided. However, this report aims to analyze the collected data, identify patterns and trends, and summarize evaluator feedback. **## DATA ANALYSIS BY CATEGORY** Since the categories evaluated and specific data points are not provided, a general approach to how the analysis would be conducted for each category is outlined below: - ****Category Analysis****: For each category, the analysis would involve examining the score distribution to understand how evaluators rated the products. This would include identifying patterns, such as whether scores tend to cluster around certain values or if there is a wide dispersion. Evaluator consensus would be assessed by looking at the consistency of scores across different evaluators for the same product. - ****Battery Hydraulics Analysis****: In the case of Battery Hydraulics, scores would be analyzed by brand groupings to compare performance across different manufacturers. This would involve aggregating scores by brand and comparing the means, medians, and standard deviations to identify any significant differences. - ****Reference to Vendor Specification Documents****: Uploaded vendor specification documents would be referenced to understand the technical capabilities and features of each product. Key data points from these documents, such as operational parameters, safety features, and maintenance requirements, would be analyzed in the context of evaluator feedback to correlate product specifications with performance ratings. **## EVALUATOR FEEDBACK ANALYSIS** The analysis of evaluator feedback would focus on identifying common themes across narratives, areas of strong agreement, and divergent opinions. This would involve: - ****Common Themes****: Identifying recurring comments or issues raised by evaluators across different products and categories. - ****Areas of Agreement and Disagreement****: Assessing whether evaluators tend to agree on the strengths and weaknesses of products or if there are significant disagreements. - ****Notable Deal-Breaker Reports****: Examining instances where evaluators identified critical issues that would prevent them from recommending a product, and analyzing these in the context of other feedback and score data. **## DATA PATTERNS & OBSERVATIONS** This section would delve into the statistical aspects of the data, including: - ****Score Distributions****: Analyzing how scores are distributed across products and categories to identify any skewness or outliers. - ****Statistical Observations****: Calculating means, medians, modes, and standard deviations for scores in each category to understand the central tendency and variability of the data. - ****Categories with Clear Frontrunners vs. Close Competitions****: Identifying categories where one product significantly outperforms others and those where the competition is close, based on score data. - ****Data Anomalies or Outliers****: Investigating any data points that significantly deviate from the norm, which could indicate exceptional performance, errors in data collection, or other noteworthy phenomena. **## SUMMARY OF COLLECTED DATA** Given the absence of specific data, a high-level overview of the collected data cannot be accurately provided. However, areas where more data may be needed would typically include categories with limited evaluator participation, products

with sparse feedback, or aspects of product performance that were not adequately covered by the evaluation process. In conclusion, while the lack of detailed data hampers the ability to provide a comprehensive analysis, the approach outlined above would be used to analyze data from the Mid-Mount Ladder Truck Equipment Evaluation. Future evaluations should prioritize collecting and reporting detailed participation statistics and evaluation results to facilitate a more thorough analysis.
